Mineral tanning consists chiefly in *tawing* (treatment with alum and salt), or in chrome tanning. There are cases where *PQ* and *P'Q'* approach different limit positions (*PT* and *PT'*, fig. 2); there is then a tangent up to *P* and another on from *P*, but not at *P*; or when *Q* is fixed and *Q'* moves faster as *Q* and *Q'* near *P* indefinitely, then the curve is crinkly and has no tangent at *P*. Similarly if *P* be fixed on a surface, as *Q* and *R* approach *P* in any way along the surface, the plane *PQR* tilts about *P*. If *P* be an ordinary point, as *Q* and *R* approach *P* indefinitely, no matter how, the tiltings become and remain infinitesimal, and the plane *PQR* settles down into a limit position and becomes the plane tangent at *P*. But if *P* were the vertex of a cone, the plane *PQR* might roll round indefinitely, so there would be no plane tangent at *P*. In general, when an extent is determined uniquely by elements (as points) on a second extent and remains so in a limiting position as the elements become coincident, the two extents are mutually tangent in the limiting position; esp., the first is tangent to the second.

Tannhäuser, moved by the philosopher Hilario, entered the enchanted cavern in the Venusberg (symbolic of sensual passion). Escaping thence, he sought the Pope, who said: "You can no more hope for pardon than this dry wand can bud and bear leaves." Tannhäuser in despair returned to the Venusberg. Meanwhile the staff miraculously budded, and the Pope sent messengers to search for Tannhäuser, but in vain. In Wagner's opera, the knight, on invoking the Virgin, is suddenly released from the Venusberg, and, led by the memory of Elizabeth, niece of the Landgrave of Thuringia, he returns to the castle of Wartburg. In a musical contest he is suddenly impelled to sing of sensual love, and but for Elizabeth would have been killed. He seeks absolution at Rome in vain. Elizabeth dies of grief. Tannhäuser, while returning to the Venusberg, is saved by the mention of Elizabeth's name. Seeing her dead he dies of grief, the blossoming of his staff indicating that he is forgiven. Cf. 4. *Physiol.* The one of the five senses by which certain properties of bodies (called their *taste*, *savor*, *flavor*) are ascertained by contact with the organs of taste. Taste depends mainly on the contact of soluble matter with the terminal organs (connected with branches of the glossopharyngeal and other nerves) in the papillæ on the surface of the tongue. The base of the tongue is considered most sensitive to bitter substances, the point to sweet and acid substances. The end-organs of the sense of *taste* are the taste buds in the epithelium of the tongue. In order to affect the bruchlike ends of the nerves of taste which ramify in these taste buds, substances must be soluble. Only four *tastes*, acid, bitter, salt, sweet, are fundamental. All others are either combinations, or, as is more common, sensations of *taste* modified by smell.

10. A smell; scent; odor. *Obs. & R.*

Syn. — Vein, streak, strain, dash, spice, touch, hint, thought, shade. — TASTE, FLAVOR, SAVOR, RELISH, SMACK, TANG are distinguished in their fig. senses. TASTE, as here compared, denotes a sample or specimen of something, rather than (as in the case of the other words) a property of it; as, "Come, give us a *taste* of your quality" (*Shak.*). FLAVOR, SAVOR, and RELISH suggest either a predominant or distinctive quality, or a tinge or trace of something; as, "The higher heroisms and the old rare *flavors* are passing out of life" (*W. James*); "The passing hour's supporting joys have lost the keen-edged *flavor*" (*G. Meredith*); "We have the art perception, we catch *flavors*, and roll them on our tongues" (*T. E. Brown*); "a Puritanism that still strove to keep in its creed the intense *savor* which had long gone out of its faith" (*Lowell*); "There was a slight *savor* of disappointment in his tone" (*Mary Wilkins*); cf. "the style here and there *savoring* too strongly of sermon" (*Gray*); "the full *flavor*, the whole *relish* of delight" (*H. W. Beecher*); "Your lordship . . . hath yet some *smack* of age in you, some *relish* of the saltness of time" (*Shak.*). SMACK and TANG (which denotes esp. a fresh or pungent flavor) are more homely and familiar; as, "the Saxon names of places, with the pleasant, wholesome *smack* of the soil in them" (*M. Arnold*); cf. "Too many negative superiorities begin to *smack* a little of the prig" (*Stevenson*); "The language has a *tang* of Shakespeare" (*Gray*); "Yankeeisms . . . whose salt-sea *flavor* has its own peculiar *tang* in it" (*Lowell*). Its use was introduced into Europe late in the 16th or early in the 17th century. *Teas* are classed as *green* or *black*, according to color, flavor, and mode of preparation. The leaves for green tea are heated, or roasted slightly, in shallow pans over a wood fire, almost as soon as gathered, after which they are rolled with the hands upon a table, to decrease the moisture and to twist them, again roasted, and quickly dried. Those for black tea are spread out in the open air for some time, and then tossed with the hands until flaccid, roasted for a few minutes, and rolled; after exposure to the air for a few hours in a soft and moist state, they are finally dried slowly over a charcoal fire. The operation of roasting and rolling is sometimes repeated several times, until the leaves have become of the proper color. The following lists show the principal commercial varieties of tea. — *Green tea:* Hyson, Young Hyson, Imperial Hyson, Gunpowder or Pearl, Twankay. *Black teas:* Pekoe, Orange Pekoe, Congo or Congou, Oolong, Souchong, Pouchong, Bohea.

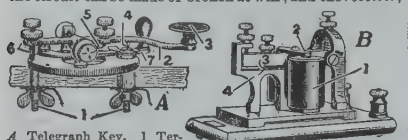
tel'e-graph (-grăf), *n.* [*tele-* + *-graph*: cf. F. *télégraphe*. See GRAPHIC.]. **1.** Orig., an apparatus for communication at a distance by means of preconcerted signals; in the broadest sense, any apparatus, system, or process for communication at a distance other than the ordinary ones of speech, letter writing, etc.; — now commonly restricted to those employing electric transmission. The **semaphore telegraph** was adopted by the French in 1794, and was in use among various nations until displaced by the **electric telegraph**, of which the form still in most common use is the **Morse telegraph**, first used publicly in 1844. This consists essentially of the **line**, a wire which forms, either in itself or in connection with the earth or water, a complete circuit; a *battery* or other electric generator for sending a current over the line; a *transmitter*, or *key*, by which the circuit can be made or broken at will; and the *receiver*,



A Telegraph Key. 1 Terminals, connecting the ends of a break in the line wire; 2 Key Lever, depressed by its Button (3), thus bringing together the platinum Points (4) and closing the circuit. When not in use, the Spring (5) holds up 2, which then rests on its Back Stop (6), the break being closed by setting the Lever (7) in the position shown. *B* Morse Telegraph Sounder. Currents from line pass through the Magnet (1), causing it to draw down its Armature (2), which brings the Stop (3) against the Anvil (4) with a click for each current passing.

an electromagnetic device affected by every make and break, which it indicates by deflection of a pointer, by marks made on a moving tape, or merely, as in the common *sounder*, by sharp clicks. (See MORSE CODE.) On long lines a *relay* becomes necessary, and in submarine telegraphy the long sheathed cable has so great an inductive effect that a very sensitive receiver such as the *siphon recorder* must be used. Of later development are the *printing telegraph*, the *writing telegraph*, or *facsimile telegraph* (see TELAUTOGRAPH), and the various systems, many highly complicated, for sending two or more messages simultaneously over a single wire. See also RECORDER, 5 a; SOUNDER, 1; TRANSMITTER; WIRELESS TELEGRAPHY, etc.

Tel'e-os'te-i (-ŏs'tē-ī), *n. pl.* [NL.; *teleo-* + Gr. ὀστέον bone.] *Zoöl.* A subclass or other division of fishes including the ordinary fishes as distinguished from the ganoids, dipnoans, crossopterygians, and elasmobranchs. Its members are called *bony fishes*, from the well-ossified vertebræ and skull (the latter complicated by the presence of many membrane bones) and from the usually dense bony tissue of the other parts of the skeleton. Enameled, or ganoid, scales, fulcra on the fin rays, a spiral valve in the intestine, and a conus arteriosus with several rows of valves, characters common in more primitive fishes, have disappeared. The optic nerves simply cross each other, the suspensorium is hyostylic, and a large membrane bone, the clavicle, forms the chief part of the pectoral arch. The true pelvic arch has disappeared; the pelvic fins are often displaced forward. The tail is apparently perfectly homocercal. The group comprises most living fishes, but is geologically rather recent, developing in the Mesozoic, but not becoming predominant until the Upper Cretaceous. The more primitive teleosts (Isospondyli) differ little from, and are evidently descendants of, certain ganoids (Holostei), and in many recent classifications the group Teleostei, if retained, is made a division of the Teleostomi.

Tel'e-os'to-mi (-tŏ-mī), *n. pl.* [NL.; *teleo-* + Gr. στόμα mouth.] *Zoöl.* **a** A subclass (sometimes a class) containing all existing fishes except the elasmobranchs, and characterized by having membrane bones developed in connection with, and entering into the structure of, the jaws, cranium, pectoral arch, and opercular apparatus. The gill arches bear filamentous gills and there are no claspers on the ventral fins. **b** In a narrower sense, a group equivalent to the above but excluding the dipnoans. It thus consists of the ganoids (including the crossopterygians) and teleosts, and is further characterized by the hyostylic suspensorium, bony fin rays, and lack of cerebral hemispheres, the prosencephalon being individual. — **tel'e-o-stome'** (tĕl'ē-ō-stōm'; tē'lē-), *n.* — **tel'e-os'to-mous** (-ŏs'tŏ-mŭs), *a.*

tel'e-phone (tĕl'ē-fōn), *n.* [*tele-* + *-phone*.] An instrument for reproducing sounds, esp. articulate speech, at a distance. The **mechanical**, or **string**, **telephone** is a device in which the voice or sound causes vibrations in a thin diaphragm, which are directly transmitted along a wire or string connecting it to a similar diaphragm, thus reproducing the sound. The first electrical telephone was publicly described by its German inventor, Reis, in 1861, but the first capable of practical use was patented by Bell in 1876. This was the **magnetic telephone**, or **magneto-telephone**, transmitter and receiver being alike constituted of a diaphragm of soft iron placed close to the pole of a magnet upon which is wound a coil of fine wire. The vibrations of the transmitting diaphragm produce by induction variable currents in the circuit connecting with the receiver, and these in turn cause the receiving diaphragm to vibrate. In the modern telephone the microphone replaces the transmitter, but the receiver is essentially the same. See *Illust.*

TELEGRAPH; -SCOPE.] **1.** An optical instrument used as an assistance to the eye or camera in viewing or photographing distant objects, as the heavenly bodies. The two chief advantages of the use of a telescope are, enlargement of the visual angle under which a distant object is seen and a consequent magnifying of the object, and collection and concentration of a larger beam of light, rendering objects visible or more distinct. The essential parts of the telescope are the object glass, or the concave mirror which collects the beam of light and forms the image, and the eyepiece, by which the image is magnified. Telescopes having an object glass are called refracting telescopes, the largest completed examples of which in use (1909) are the Lick telescope (36 inches aperture) and the Yerkes telescope (40 inches). To this class belongs the Galilean telescope, in which the eyeglass is a concave instead of a convex lens, as in the common opera glass, the construction originally adopted by Galileo, in 1609. It exhibits objects erect, that is, in their natural position. If the light is collected by a mirror, the instrument is called a reflecting telescope, the earliest form being the Gregorian telescope, perfected by James Gregory of Edinburgh in 1663. In the axis is a small concave mirror having its focus coincident with that of the large reflector and transmitting the light received from the latter back through a hole in the center of the large mirror to the eyepiece behind (see *E*, Fig. 2). The Cassegrainian telescope (invented by Cassegrain in 1672) differs from the Gregorian only in having the secondary mirror convex instead of concave, placed nearer the large one, and in representing objects inverted. In the Newtonian telescope (invented by Sir Isaac Newton) the rays from the large speculum are received by a diagonal plane mirror (now usually a prism) near the open end of the tube, and are reflected at right angles to one side, where the image is formed and viewed through the eyepiece (see Fig. 1). In the Herschelian telescope (invented by Le Maire, but extended by Sir William Herschel) only one speculum is employed (*S* in Fig. 3), by slightly inclining which an image of the object is formed near one side of the open end of the tube, and to this the eyepiece (*E*) is directly applied. In a mercurial telescope the rays are reflected from a basin of mercury, either in revolution or at rest. The largest reflector ever constructed is that of Lord Rosse (6 feet in diam.) and the largest now in use (1909), that built by Dr. Common (5 feet), of modified Newtonian type. See EQUATORIAL, *n.*, POSITIVE EYEPIECE, NEGATIVE EYEPIECE, LENS, 1.

on the different keynotes C, D, etc., have comparatively few tones coinciding in pitch: thus, c♯ of the key of D differs by a perceptible interval from d♭ of the key of A♭. Temperament produces a set of compromise tones, certain intervals in each scale being made slightly dissonant in order that single tones may answer for two or more of nearly like pitch (as c♯ and d♭) and twelve fixed tones to the octave may answer for all the scales or keys. In treating these dissonances two kinds are distinguished: **unequal temperament**, which keeps pure or nearly pure intonation in certain keys, and accumulates the dissonances, called the "wolf," in the remaining little used keys; **equal temperament**, which distributes the "wolf" evenly between all the keys, all being thus available for modulation. The latter is now universal in keyboard instruments.

The order was at first limited in numbers, and its members were bound by vows of chastity and poverty. After the conquest of Palestine by the Saracens the Templars spread over Europe and were enriched by donations of money and lands. Their great power and wealth, however, made them political enemies, until, on the accusation of heresy and other offenses, the order was finally suppressed by the Council of Vienne in 1312.

It gives off the **middle temporal** above the zygoma, and farther up divides into the **anterior** and **posterior temporals**. — **t. bone**, a compound bone of the side of the human skull. It consists of three principal parts: the **squamous portion** (representing the squamosal of other vertebrates), a large scalelike plate forming part of the wall of the brain case and temporal fossa and bearing externally the zygomatic process; the **petrous portion**, containing the internal ear and representing the periotic bones of lower vertebrates; and the **mastoid portion** or process, a posterior and external outgrowth of the petrous portion, containing air cells. Other elements are also united with these. As these elements are mostly distinct in other vertebrates and even in many mammals, the term *temporal bone* is little used outside of human anatomy. In other mammals and many other vertebrates, a corresponding fossa is recognizable. In many reptiles the supratemporal arch divides it into an upper *supratemporal fossa* and a lower or more lateral *infratemporal* or *lateral temporal fossa*. — **t. lobe**, a large lobe of each cerebral hemisphere situated below the fissure of Sylvius, and in front of the occipital lobe. It contains the middle or descending cornu of the lateral ventricle. — **t. muscle**, a large muscle in the temporal fossa, serving to raise the lower jaw. In man it is composed of fibers arising from much of the surface of the temporal fossa and converging to an aponeurosis which contracts into a thick, flat tendon inserted into the coronoid process of the mandible. — **t. nerve**, any of several nerves supplying the structures of the temporal region. They are derived from the facial and inferior maxillary nerves. — **t. ridges**, two nearly parallel curved ridges or lines on each side of the skull, chiefly on the parietal bone. — **t. sulcus**. tenancy at, or by, sufferance, *Law,* the tenancy which arises when a tenant under a lawful demise holds over after his estate is ended. Strictly it is to be regarded merely as a legal fiction to prevent the owner from treating the tenant as a trespasser until he has himself made an actual entry on, or has brought an action to recover, the land, since the landlord's acquiescence changes the tenancy at sufferance to one at will. The tenant at sufferance may at common law be ejected by such force as is reasonably necessary, and is not entitled to emblements. At common law notice of termination must be given at least six months before the expiration of the current year; and under the English Agricultural Holding Act (1883) one year's such notice must be given in the absence of a written agreement to the contrary. In some of the United States the period has been shortened. — **t. in common,** the tenancy of those who hold lands or other property in common. See COMMON, *n.*, 3; cf. JOINT TENANCY.

curred by nonpayment or nonperformance; as, the *tender* of rent due, or of the amount of a note, with interest. To constitute a valid lawful tender the offer must comply with all the conditions of actual performance as regards time, place, and manner, and must be unconditional. In any case the requirements of a tender may be dispensed with by the positive act or declaration of the person to whom it is made, as by his declaring that some act is unnecessary, or that he will not accept the thing offered, or such show of violence as makes a lawful tender unsafe, etc.

tenement house. Commonly, a dwelling house erected or used for the purpose of being rented, esp. one divided into separate apartments, or tenements, for families. Often, esp. in reference to large cities, such a building occupied as dwellings by the poorer classes. Cf. APARTMENT HOUSE, FLAT HOUSE. Sometimes, as for building and sanitary purposes, what shall constitute a tenement has been prescribed by statute, as in New York and Pennsylvania. See *Citation. Tenement house* as used in a covenant (not to erect a tenement house) has been held not to include a modern high-class apartment house (62 *App. Div.* (N. Y. 1)). In the law no distinction is made between flat houses, apartment houses, and the poorest class of tenements popularly called "*tenement houses.*" They all have many parts used in common by the different families of occupants, and receive some quasi-public care and supervision. The definition of tenement house of the New York Tenement House Act (see *Cit.*) is a typical statutory definition.

A *tenement house* is any house or building, or portion thereof, which is rented, leased, let, or hired out to be occupied, or occupied, as the home or residence of three families or more living independently of each other, and doing their cooking upon the premises, or by more than two families upon any floor, so living and cooking, but having a common right in the halls, stairways, yards, water-closets, or privies, or some of them.

Later the prætor gave bonorum possessio to the heir named if the instrument bore the seals of seven witnesses even though it were informal, this being called the prætorian testament or will. The ‖ **tes'ta-men'tum tri'per-ti'tum** (trĭ'pẽr-tī'tŭm) was a later imperial form named from the three requisites of seven witnesses, signatures of all at the foot, and the affixing of seals as required by the prætor. Teutonic Knights, a military and religious order founded at Acre in 1190 as a brotherhood of German crusaders. It became a political rival of the Templars and Hospitalers, exceeding either in its territorial possessions, and winning great power and prestige in its conquest of the heathen Prussians. A branch still exists in Austria as a semireligious knighthood, esp. devoted to the ambulance service. — **T. race**, one of the most important of the European races, the type being characterized by tall stature, long head and oval face, blue eyes, blond hair and skin, and narrow prominent nose. It is considered by Ripley as probably a variety of the neolithic dolichocephalic race of western Europe (from which also the Mediterranean race in Europe is derived), its distinctive blondness and high stature having been acquired during a long period of isolation in Scandinavia cut off from the Mediterranean branch by the intruding Alpine race. At its appearance in history its habitat comprised most of Germany, the Netherlands, and Scandinavia. In the later years of the Roman Empire and at its breaking up, many Teutonic peoples forced their way into central and southern Europe and even into Africa. Among them were the Burgundians, Goths, Franks, Vandals, Lombards, Angles, Saxons, and Jutes, and later Danes and Norwegians (including the Normans). Hence, central and western Europe received a strong infusion of Teutonic blood, while in English and German colonies the race has spread into most temperate regions. Most of the divisions of the race speak languages of the same family (the Teutonic). Ripley, however, classes as wholly or partly Teuton the Finns and other east Baltic peoples of entirely distinct linguistic affinities.

The chief text of the Old Testament, on which all existing manuscripts and versions are based, is the **Masoretic text**, or the text of the Masora. See MASORA. The chief text of the New Testament is the **Textus Receptus**, or **received text**, a Greek text so called from the claim in the Elzevir edition of 1633 that it represents the text as received by the best authorities. This is essentially the same as that publicly read in the Eastern Church since the 5th century. It is also essentially the same as one that would result if a text were formed by taking the readings of the majority of the Greek manuscripts, which would be practically the same as the text accepted by Chrysostom, and by Theodoret and other writers of Antioch, and also of most of the later Greek fathers; and is therefore variously called the **Antiochian, Syrian**, or **Byzantine text**. Besides the Antiochian, three other broad theoretical divisions of earlier texts (often called as a body **Antenicene text**) have been made: the **Alexandrian text**, a type of text traceable chiefly to Alexandria and Lower Egypt; the **Western text**, so named from a supposition that it arose in the west of Europe, but found widely distributed in Asia, Europe, and Africa; and the **neutral text**, a type not so clearly associated with any local use, and showing correct readings of both the previous texts as opposed to the corruptions of the other.

more remote. When they refer to foregoing words or phrases, *that* usually refers to the former.

Two principles in human nature reign;
Self-love, to urge, and Reason, to restrain;
Nor *this* a good, nor *that* a bad we call. *Pope.*

2. As an adjective (*pl.* THOSE), with the same demonstrative force as the pronoun.

The woman was made whole from *that* hour. *Matt.* ix, 22.

Hence in special uses: **a** Referring esp. to qualities with the force of *such*, and followed by a defining expression, sometimes by a correlative word.

That gentleness . . . as I was wont to have. *Shak.*

b Formerly, sometimes, with the force of the article *the*, esp. in the phrases *that one, that other*, subsequently corrupted into *th' tone, the 'tother* (now written *t' other*).

Upon a day out riden knightes two . . .
That one of them came home, *that other* not. *Chaucer.*

c Implying that something is familiar or well known, often with a sense of disparagement; as, *that* bland air of his.

3. As a relative pronoun, equivalent to *who* or *which*, either sing. or pl. "He *that* reproveth a scorner." *Prov.* ix. 7. "A judgment *that* is equal and impartial." *Bp. Wilkins.* Hence in special uses: **a** In early English, often with the demonstratives *he, his, him*, etc., the two together having the force of a relative pronoun; thus, *that he* = who; *that his* = whose; *that him* = whom.

I saw to-day a corpse y born to church
That now on Monday last I saw *him* wirche [work]. *Chaucer.*

b As a correlative of *so* or *such*. *Archaic.*

Who is here so rude *that* would not be a Roman? *Shak.*

c For *that which, what*. *Archaic.*

We . . . testify *that* we have seen. *John* iii 11.

d Adverbially, for *on, in*, or *at, which*.

In the day *that* thou eatest thereof. *Gen.* ii. 17.

e A preposition governing *that* cannot precede it, but is transposed to the end of the clause.

The ship *that* somebody was sailing in. *Scott.*

The relative *that* succeeded to the early indeclinable relative *the*, and in the 14th century was the common relative. In the 16th century it was often replaced by *which*, and in the 17th by *who*; in the 18th, however, Steele complained that it was supplanting both *which* and *who*. Present usage generally favors *who* or *which* when the relative clause conveys a qualification or statement simply additional or parenthetic, and *that* when it is definitely restrictive. Thus, "the members, *who* were present," is distinguished from "the members *that* were present," the latter restricting the application to certain members present as opposed to others that were absent. The awkwardness of *that that* (the demonstrative and relative together) is, however, now usually avoided by means of *that which*, and the rule is further disregarded where the relative is to follow a preposition or to be in the possessive case, *that* being impossible in either construction; as, to choose the plans by *which* we work; pleasing to men *whose* opinions concur. The simply descriptive or parenthetic clause is, in any case, distinguished by a comma before the relative.

That *that* dieth let it die; and that *that* is to be cut off, let it be cut off. *Zech.* xi. 9.

Syn. — See WHO.

that a way, that way. *Dial.*

that (thăt), *conj.* A connective probably derived by loss of stress from the demonstrative *that*, regarded as in apposition with a clause. Thus, 'he knew I had come' could have an appositional *that* before the object clause: 'he knew *that*, [viz.] I had come,' in which *that*, when unstressed, becomes a mere sign to mark the following clause as one taken substantively. In older English it is thus used when the clause is object of a preposition, as in "Before *that* thou shalt thrice deny," where now it is omitted, and the preposition is taken as a conjunction. *That* sometimes occurred analogously after a conjunction; as in, "If *that* our own be ours." It is used: **1.** To introduce a clause employed as object, subject, or predicate nominative of a verb.

She tells them 'tis a cause they fear.
And childish error, *that* they are afraid. *Shak.*

I have shewed before, *that* a mere possibility to the contrary, can by no means hinder a thing from being highly credible. *Bp. Wilkins.*

2. To introduce a reason or cause; — equivalent to *for that, in that, for the reason that, because*.

He does hear me;
And *that* he does, I weep. *Shak*

3. To introduce a purpose; — usually followed by *may*, or *might*, and often preceded by *so, in order, to the end*, etc.

These things I say, *that* ye might be saved. *John* v. 34
To the end *that* he may prolong his days. *Deut.* xvii. 20.

4. To introduce a consequence, result, or effect; — usually preceded by *so* or *such*, sometimes by *that*.

He gazed so long
That both his eyes were dazzled. *Tennyson.*

5. To introduce a clause denoting time; — equivalent to *in which time, at which time, when*.

So wept Dueasa until eventide,
That shining lamps in Jove's high course were lit. *Spenser.*

Is not this the day
That Hermia should give answer of her choice? *Shak.*

6. In an elliptical sentence to introduce a sentence or clause expressing a wish, cause of surprise, indignation, etc.

Ha, cousin Silence, *that* thou hadst seen that that this knight and I have seen! *Shak.*

O God, *that* right should thus overcome might! *Shak.*

7. To take the place of another conjunction, instead of repeating the latter before a clause with which it belongs. Cf. the similar use of the French *que*.

When he had carried Rome, and *that* we looked
For no less spoil than glory. *Shak.*

that, *adv.* To such a degree; so; — used: **a** *Colloq.* With words of degree or extent; as, she did n't go *that* far. **b** *Archaic or Dial.* With words denoting quality or action; as, he was *that* frightened he could say nothing.

BOTH.] A demonstrative word used esp. before a noun to particularize its meaning, having a force thus distinguished from the indefinite distributive force of *a, an*, and from the abstract force of the unqualified noun. the'a-tre } L. *theatrum*, Gr. θέατρον, fr. θεᾶσθαι to see, view; cf. θέα a sight. Cf. THEORY.] **1.** An edifice for dramatic performances or spectacles. The typical Greek theater, as that at Athens, was an auditorium of greater than semicircular plan, constructed or hewn in the hollow of a hillside, in rising concentric tiers of seats accommodating over 10,000 spectators. At first it probably had no stage, the actors and chorus performing together in the circular orchestra, in the center of which stood the altar of Dionysus. But later an actors' booth (σκηνή) was added beyond the orchestra, with a long screen wall, pierced with openings and serving as a scenic background, and, in time, as the basis of a platform. In the Roman theater — adapted from the Greek — the auditorium was often built up from the level, at first in wood, later in stone. The orchestra was a half circle, and was used for seats of honor, as for senators. At the chord of the half circle was a stage, with a curtain and a rear wall pierced by three or five doors. The medieval mysteries, miracle plays, etc., were generally given without any fixed place. The first permanent theater in London was built about 1576 by Burbage, who also built (in 1598) the Globe Theater, in which Shakespeare's plays were produced. The latter was a wooden hexagonal structure, partly open at the top, with a pit for the common folk to stand in, galleries running round three sides for the gentry, and special seats on the stage for the gallants. Modern theaters have two main parts: (1) the auditorium, inclosing boxes flanking the proscenium arch, with the entrance corridors, lobbies, foyer, etc.; (2) the stage, with its side wings and flies, and with dressing rooms, etc., for the actors.

ther-mom'e-ter (thẽr-mŏm'ē-tẽr), *n.* [*thermo-* + *-meter*: cf. F. *thermomètre.* See THERMAL.] Any device for measuring temperature. Strictly speaking, temperature is not a measurable property, but its rise and fall can be estimated in terms of accompanying changes. In most thermometers the expansion and contraction of a liquid or gas are utilized. The common form consists of a glass tube of capillary bore, terminating in a bulb, and containing mercury or alcohol, which indicates the degree of heat to which it is exposed by the amount of space it occupies, as shown by the position of the top of the liquid column on a graduated scale. See CENTIGRADE, FAHRENHEIT, REAUMUR. See also REGISTER THERMOMETER. The **gas thermometer** consists of a body of gas suitably confined so that its changes of volume (at constant pressure) or changes of pressure (at constant volume) can be noted. Physicists have adopted as a standard the constant volume hydrogen thermometer, in connection with the centigrade scale. The **metallic thermometer** indicates changes of temperature by the expansion or contraction of rods or strips of metal. **Electric thermometers** are of two kinds: (1) **Resistance thermometers,** based on the increase in the electric resistance of metals with increase in the temperature. Usually the resistance of a platinum wire is measured, when the instrument is called also a **platinum thermometer.** (2) **Thermoelectric thermometers,** essentially thermoelectric couples. Temperatures may also be measured by means of a set of cones fusing at different points, by the calorimeter, etc. Cf. PYROMETER, **b.**

☞ To reduce degrees Fahrenheit to degrees centigrade, subtract 32° and multiply by $\frac{5}{9}$; to reduce degrees centigrade to degrees Fahrenheit, multiply by $\frac{9}{5}$ and add 32°. To reduce degrees Reaumur to degrees centigrade, multiply by $\frac{5}{4}$.

When we speak of an object, or of a *thing,* we are almost always supposed to mean a substance. There seems a kind of contradiction in using such an expression as that one *thing* is merely an attribute of another *thing.* *J. S. Mill.*

Below the level of organic form, or form given by human interference, what do we mean by a *thing?* Of course we may take a lump of metal or an ounce of water, a handful of sand or a jarful of chlorine, and speak of it as a *thing;* but we shall be puzzled to find any name that recognizes its separate identity as " lion " or " spade " or " house " recognize that of the contents that form their meaning. *B. Bosanquet.*

A physical *thing,* "res corporalis"... is sometimes defined as "a locally limited portion of volitionless nature;" perhaps better as "a permanent external cause of sensations." . . . The jurist need not go further than to lay down that a physical *thing* is something which is perceptible by the external organs of sense, and is capable of being perceived again and again. By the latter characteristic it is distinguished from an "event," which, as a cause of sensations, is transient. *T. E. Holland.*

thoracic aorta, *Anat.*, the part of the aorta beyond the arch, which is contained in the thorax. — **t. artery,** *Anat.*, any of several branches of the axillary artery supplying the pectoral muscles, walls of the thorax, axilla, etc. They are designated (in the order in which they usually branch off) the *superior, acromial, alar*, and *long*. — **t. chole,** a choked condition seen chiefly in the horse and ox, due to obstruction of the thoracic part of the esophagus. — **t. duct,** *Anat.*, the main trunk of the system of lymphatic vessels. It lies along the front of the spinal column, beginning on a dilatation (**receptaculum chyli**) behind the aorta, opposite the second lumbar vertebra, and, extending up through the thorax, turns to the left and opens into the left subclavian vein. It receives the lymph and chyle from all parts except the right side of the head, neck, and thorax, right arm, right lung, right side of the heart, and convex surface of the liver. The lymphatics of these parts discharge by a short trunk (**right lymphatic duct**) into the right subclavian vein. — **t. limbs,** *Zoöl.*, the fore limbs of a vertebrate or the appendages of the thorax of arthropods. — **t. nerves,** *Anat.*, nerves arising from the brachial plexus and supplying chiefly certain muscles of the walls of the thorax. The *internal* and *external anterior thoracic* nerves supply the pectoral muscles, the *long* or *posterior*, the serratus magnus.

tho'ra-co- (thō'rȧ-kō-; thō-răk'ō-). Combining form fr. Gr. *θώραξ, θώρακος, thorax, chest.* Cf. THORACI-.

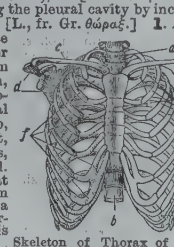
Gr. *θώραξ.*] **1.** *Anat. & Zoöl.* The part of the body of man or of the higher vertebrates situated between the neck and the abdomen, and whose walls are supported by the ribs, costal cartilages, and sternum; also, the cavity contained in it, in which the heart, lungs, esophagus, etc., are situated. It is only in mammals that its cavity is shut off from that of the abdomen by a diaphragm; in the lower vertebrates a distinct thorax is not recognizable.



Skeleton of Thorax of Man. *a* First Dorsal Vertebra; *b* Twelfth Dorsal Vertebra; *c* Clavicle; *d* Scapula; *e* Sternum, or Breastbone; *f* Costal Cartilages; *g* Sternal Ribs; *h i* False Ribs; *i* Floating Ribs.

2. *a* In insects, the middle of the three chief divisions of the body, consisting of three somites (*prothorax, mesothorax*, and *metathorax*), each commonly bearing a pair of legs, and usually the last two each bearing a pair of wings in the adult. In most crustaceans and arachnids a thorax bearing ambulatory legs is recognizable, but usually fused with the head somites into a *cephalothorax*. *b* In zooids of compound ascidians, the anterior division of the body comprising the branchial sac and surrounding atrium. *c* In many tubicolous Polychæta, an anterior differentiated part of the body behind the head.
3. *Antig.* A breastplate, cuirass, or corselet; esp., the breastplate worn by the ancient Greeks.

tho'ri-um (thō'rĭ-ŭm), *n.* [NL. See THORITE.] *Chem.* A comparatively rare metallic element occurring in combination in thorite, monazite, and certain other minerals, and isolated as an infusible gray metallic powder having the sp. gr. 11.1. Symbol, *Th*; atomic weight, 232.4. It was discovered by Berzelius in 1828 in thorite. It has a valence of four; its compounds are analogous to those of zirconium. The oxide, ThO_2, is prepared from monazite on a large scale and used in gas mantles. See WELSBACH BURNER. Thorium is radioactive, emitting, like radium, alpha (α), beta (β), and gamma (γ) rays. In its transformation it yields a long series of products, given by Hahn as follows: Thorium → **thorium** 1 (*mesothorium*) → **thorium** 2 (*mesothorium* 2) → **thorium** 3 (*radiothorium*) → **thorium X** → **thorium emanation** → **thorium A** → **thorium** → **B** thorium **C** → inactive end product. The name radiothorium was orig. applied to what was supposed to be a single product between thorium and thorium X.

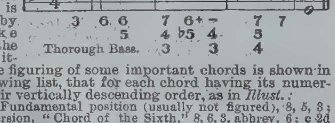
thor′ough bass′ (bās′). *Music.* **a** The representation of chords by figures placed under the bass; a continuous bass voice part with numerals showing stenographically the harmony; figured bass; basso continuo;—sometimes used loosely for *harmony*, or harmonic composition generally. **b** The system of numerals and other marks so used. Thorough bass was regularly used by the old masters, esp. for noting organ accompaniments in choral and other large scores, but the present practice of writing scores out in detail has relegated the system to textbooks and exercises in harmony. The numerals indicate the intervals between each given bass note and such constituent tones of the chord as are necessary to identify it, showing nothing as to the actual leading of the upper voice parts, which is left to the rules for chord succession. The soprano of the opening chord, however, is often indicated. In two successive chords any tones of the second that are retained from the first are marked simply by dashes. A chromatic change from the original key is marked by a ♯, ♭, or ♮ alone, if it occurs in the third above the bass; if in any other tone, the accidental is affixed to the numeral for it, except that sharping is marked by a stroke through the numeral itself.



Thorough Bass.

3. The alternate rising and falling of the surface of the ocean, and of gulfs, bays, rivers, etc., connected with the ocean. The tide ebbs and flows twice in each lunar day (24 h. 51 m.). It is occasioned by the attraction of sun and moon (the tide-raising force of the latter being three times that of the former), acting unequally on the waters in different parts of the earth, thus disturbing their equilibrium. High tide upon one side of the earth (**direct tide**) is accompanied by high tide upon the other side (**opposite tide**). Hence, when sun and moon are in conjunction or opposition, as at new moon and full, their combined action produces a tide greater than usual, called **spring tide**, as shown in *Illust.* (right and left). When the moon is at first or third quarter (above or below), the sun's attraction in part counteracts the moon's, causing (under the moon and opposite it) a smaller high tide than usual, called **neap tide**. The flow or rising of the water is called **flood tide**; the reflux, **ebb tide**.

time (tīm), *n.* [ME. *time*, AS. *tīma*, akin to *tīd* time, and to Icel. *tími*, Dan. *time* an hour, Sw. *timme.* See TIDE, *n.*] **1.** That in which events are distinguished with reference to before and after, beginning and end; relation with reference to concurrence or succession; the measurable aspect of duration; that within which change is determined. Metaphysically, *time* is distinguished: first, as *absolute, real,* or *mathematical;* second, as *subjective* or *empirical.* Both conceptions view it as a relation of change to continuity, although the element of continuity or duration is stronger in the former view, the element of change or sequence in the latter. As described by Newton, **absolute time** is conceived as flowing at a constant rate, unaffected by the speed or slowness of the motion of material things. The modern view of time is mainly a development of Kant's doctrine that it is an a priori mental form which experience necessarily assumes. According to the modern view, *time* is essentially *subjective,* and even the standards of time which we regard as the most fixed and stable, such as **astronomical time,** are held to be purely ideal constructions. Many thinkers, however, distinguish real time from *individual,* or *psychological, time.* Cf. SPACE, 1.

Of *time* as of space we cannot assert a real existence; it is not in things, but is our mode of perceiving them. *Karl Pearson.*

Space and *time* may be called the categories of sense. That is to say, they are the only principles according to which the world of sense perception, both of our own immediate feelings and of external objects, appear to us to be possible. *B. Bosanquet.*

Time and space, I have contended, belong neither to the subject alone apart from the object, nor to the object alone apart from the subject, but to experience as the duality of both. They are neither subjective forms psychologically or logically prior to experience, nor are they objective realities independent of experience. *James Ward.*

2. A particular period or part of duration, past, present, or future; a point or portion of duration; as, the *time* was, or has been, is, or will be; a long or short *time.*

3. A particular period in history; the period at or in which some definite event or events occurred, or person lived; age; period; era; as, in the *time* of Cæsar; — often in *pl.;* as, ancient *times;* specif., *Geol.,* a division of geologic chronology; as, Paleozoic *time.*

4. Allotted, appointed, fixed, or customary period of time; specif.: **a** The duration of one's life; the hours and days which a person has at his disposal.

6. Available or vacant time (in sense 2); leisure; sufficient or convenient time; as, little *time* for reading; to ask for *time* to pay a debt. Also, proper time (in sense 2); season; a fitting time.

7. A definite or precise point or moment of time; as, to consult a watch to learn the *time;* also, a fixed or inevitable point of time, esp. that for departure or death; as, I thought my *time* had come; specif., *New York Stock Exchange,* 2.15 P. M., before which hour securities must be delivered on contracts maturing on the current day.

8. A portion of time considered with respect to the effect upon one's self or upon the community of what has occurred or is occurring, or has been done or is being done, during it, or with respect to the state of affairs prevailing; — often in *pl.:* as, he has a hard *time;* *times* are dull.

9. All of future time; eternity. *Obs. or R.* *Shak.*

10. Reckoning of time or way of reckoning the lapse or progress of time; as, astronomical, civil, mean, sidereal, solar, or standard *time.*

12. *Pros.* A unit of duration, as a basis for meter; esp., the primary or least unit of quantity, the semeion, or mora.

13. *Music.* **a** The grouping of the successive rhythmic beats or pulses into equal measures; — also called *meter,* and *rhythm* (which see). The length of the rhythmic beats is represented by a note — as a half, quarter, eighth, etc. — taken as a time unit, an equal number being marked off to the measure by the principal "grammatical" accents, the position of which is represented by the bar before them. See TIME SIGNATURE. **Simple time** is that which groups the beats or time units simply by twos or threes, and is indicated by the numerator 2 or 3 in its signature, where **compound time,** which is made up of two or three (sometimes more) simple groups, has a multiple of 2 or 3. **Duple,** *or* **two-part, time** has two or four time units to the measure. The common signatures for simple duple time are $\frac{2}{2}$, $\frac{2}{4}$, $\frac{2}{8}$. Those for compound duple time — generally called **quadruple,** *or* **four-part, time** — are $\frac{4}{2}$, $\frac{4}{4}$, $\frac{4}{8}$. See ALLA BREVE, COMMON TIME. **Triple,** *or* **three-part, time** has three or nine units to the measure. The common signatures for simple triple time are thus $\frac{3}{2}$, $\frac{3}{4}$, $\frac{3}{8}$. Those for compound triple time — also called **nonuple,** *or* **nine-part, time** — are $\frac{9}{2}$, $\frac{9}{4}$, $\frac{9}{8}$. **Mixed time** is that which compounds or doubly compounds groups of three units by twos, or of two units by threes. The former kind only, accented as in duple time, is given a distinctive signature. Thus **sextuple,** *or* **six-part,** time (first variety), designated $\frac{6}{2}$, $\frac{6}{4}$, or $\frac{6}{8}$, is accented as in the *Illust.* Common forms of doubly compounded mixed time are $\frac{12}{2}$, $\frac{12}{4}$, $\frac{12}{8}$ time. Mixed time derived from triple

The Titans include: Cronus and Rhea, from whom were descended Zeus and the Olympians; Iapetus and Themis and their descendants, Atlas, Epimetheus, Prometheus, Dione, Maia; Cœus and Phœbe and their daughter Leto; Oceanus and Tethys; Hyperion and Theia; Creus and Mnemosyne. The great event in Titan history was the **Ti′tan-om′a-chy** (-ŏm′ȧ-kĭ), or war with the Olympian gods in Thessaly, which resulted in the overthrow of the Titan dynasty. See GIANT, 1; GIGANTOMACHY; cf. CRONUS, PROMETHEUS.
The *Titans* were the earliest children of the earth, elder than the Greek gods even, and were the sons of the earth, their mother. You perhaps think of them as mere giants, such as Jack killed — medieval monsters of the kin of Beauty and the Beast. Think of them rather as majestic forms, with something of the sweep and mystery of those figures you may remember out of Ossian and his misty mountains, with the largeness and darkness of the earth in them, a massive dim-featured race, but with an earthly rather than celestial grandeur, embodiments of mighty force dull to beauty, intelligence, light. *G. E. Woodberry.*

See TEN; cf. TENTH, TEIND.] **1**. The tenth part of anything; a tenth; hence, any small or insignificant part or proportion. *Bacon.*
2. A tenth part, or loosely a small part, of some specific thing paid as a voluntary contribution or as a tax to a superior for a public use, or the like; esp., as in British usage, a tenth part of the yearly increase arising from the profits of land, stock, or personal industry paid, in kind or money, to the church or for religious or charitable uses; hence, any small ratable tax or levy. The levying of tithes in kind was practiced by the Hebrews and other races in the remotest antiquity. The custom of paying tithes survived in the Christian church as a voluntary contribution, but finally became generally established as a legal tax throughout Great Britain and Europe. Ecclesiastical tithes are generally classified as: **prædial tithes**, or those arising immediately from the soil, such as grain, hemp, flax, hay, fruit, wood; **mixed tithes**, or those arising from things nourished by the immediate products of the soil, such as colts, calves, wool, fowls, milk or cheese, honey and wax, etc.; and **personal tithes**, or those derived from the profits of industry in the arts, trades, commerce, etc. A further distinction is often made into **great tithes** and **small**, or as sometimes called **privy, tithes**, the exact line of demarcation between which is uncertain, it being settled, however, that mixed and personal tithes are small tithes, and generally agreed that corn, hay, and wood are great tithes. The small tithes are also known as **vicarage**, or **vicarial, tithes**, from the fact that they sometimes belong to the vicar instead of the rector, the great tithes being then known as **parsonage**, or **rectorial, tithes**. In English law tithes are technically incorporeal hereditaments in gross; in the Civil law they are servitudes. In Great Britain and Ireland nearly all tithes have been commuted to a money payment under the various Tithe Commutation Acts. In Scotland tithes are technically called *teinds*.
In some cases, indeed, the vicar, as well as the rector, is entitled to some part of the tithes; but all *tithes*, prima facie, and by presumption of law, belong to the rector, except such as can be shown to belong to the vicar. *Stephen's Comm.*

There can be no doubt that over a large part of England the persons subject to the law of frankpledge were distributed into groups, each consisting of ten, or in some cases of twelve or more, persons; each group was known as a "*tithing*;" each was presided over by one of the associated persons who was known as the chief-pledge, tithingman, headborough, borsholder, head, or elder, that is of the borh or pledge. *Pollock & Maitland.*

Jur.* 883); as, good *title* to an estate, or an imperfect *title*. In commentators on Roman law the term *title*, or *titulus*, has been distinctively applied to the remote cause of a right, as a contract of sale, and the term *modus* to the proximate cause, but such distinction is now abandoned or little observed. **c** The instrument which is evidence of a right.

Many now work in the salmon industry.

to (tōō, *unemphatic*, tŏō; 270), *prep.* [AS. *tō*; akin to OS. & OFries. *tō*, D. *toe*, G. *zu*, OHG. *zuo, zua, zō*, Russ. *do*, Ir. & Gael. *do*, OL. *-do, -dō*, as in *endo, indu*, in, Gr. -δε, as in οἴκαδε homeward. Cf. TOO, TATTOO a beat of drums.] Primarily *to* denotes the relation of approach and arrival, making its governed word denote the terminus. Hence: **1.** It indicates that toward which there is movement and at which there is arrival; also, that toward which there is movement, tendency, or position, without arrival; — opposed to *from*; as, from east *to* west.

Stay with us, go not *to* Wittenberg. *Shak.*
She stretched her arms *to* Heaven. *Dryden.*

2. Hence, it indicates anything regarded as a terminal point or limit in the direction of which, or as far as which, there is movement, continuance, action, etc.; as, he went *to* law about it; she remembered it *to* her dying day; he rose *to* wealth and honor; they came *to* the last man.

Stand dumb and speak not *to* him. *Shak.*

3. In various extensions of its primary sense *to* connects transitive verbs with their remoter or indirect object, and adjectives, nouns, and intransitive or passive verbs with a following noun which limits their action or application. Here it supplies the place of the dative. Its sphere verges upon that of *for*, but it contains less the idea of design or appropriation; as, these remarks were addressed *to* a large audience; let us keep this seat *to* ourselves; a substance sweet *to* the taste; duty *to* God and *to* our parents; to take a dislike *to* spirituous liquor. In various obsolete or dialect uses *to* occurs where in standard usage *on, against, at, with*, are now preferred. "When the sun was *to* rest." *Chaucer.*

Numbers were crowded *to* death. *Clarendon.*
Fate and the dooming gods are deaf *to* tears. *Dryden.*

4. With the infinitive, *to* had originally the use last defined, governing the Old English dative infinitive in *-enne* as a verbal noun, and connecting it as indirect object with a preceding verb or adjective; thus, *tō* writenne, *to* or *for* writing; so also now, ready *to* go, i. e., ready unto going; good *to* eat, i. e., good for eating; I do my utmost *to* lead my life pleasantly, i. e., unto the leading my life pleasantly. But in many constructions, esp. those in which the infinitive is subject, object, or predicate noun, *to* has lost its prepositional force, and become simply the sign of the infinitive; thus, I love *to* learn, i. e., I love learning; *to* die for one's country is noble, i. e., the dying for one's country. See INFINITIVE, *n.* The infinitive with *to* could formerly be governed by *from*; as in, "could save the son of Thetis *from to die*" *(Spenser)*; also by *for*, as still in archaic, dialectic, or illiterate speech. "What went ye out *for to see?*" *Matt.* xi. 8. In colloquial usage *to* often stands for, and supplies, an infinitive already mentioned; thus, he asks me to come, but I don't wish *to*. For other idiomatic uses of the infinitive with *to*, see BE, 1, and HAVE, 4.

5. In many phrases, and in many connections, *to* has a pregnant meaning, or is used elliptically. Thus, it denotes or implies: **a** Effect; end; consequence; as, the prince was flattered *to* his ruin; he engaged in a war *to* his cost. **b** Opposition; antithesis; as, they engaged hand *to* hand. **c** Accord; adaptation; as, an occupation *to* his taste.

He *to* God's image, she *to* his was made. *Dryden.*

d Comparison; as, three is *to* nine as nine is *to* twenty-seven; it is ten *to* one that you will offend him.

All that they did was piety *to* this. *B. Jonson.*

e Addition; union; accumulation.

Wisdom he has, and *to* his wisdom, courage. *Denham.*

f Appurtenance; belonging; as, a kite with a tail *to* it; brother *to* the king. **g** Accompaniment; as, she sang *to* his guitar; they danced *to* the music of a piano. **h** Character; condition of being; purpose subserved or office filled; as, he had a king *to* his father. *Archaic.*

Sagittarius forsooth men seggen [call] it *to* name. *Wars of Alex.*

to, *adv.* **1.** Forward; on; — sometimes as a command.

To, Achilles! *to*, Ajax! *to*! *Shak.*

2. To the matter or business in hand; as, we were hungry and fell *to* with a will.

3. To or at the normal position; as, put *to* the door, i. e., shut it; with the wrong end *to*; also, esp. in the nautical expressions, heave *to*, come *to*, to a certain position.

to and again, to and fro. *Rare.* — **to and fro,** forward and back. — **to and to,** backwards and forwards; to and fro. *Obs.*

[AS. *tō-* asunder; akin to G. *zer-*, and perh. to Gr. δυς-.] An intensive prefix used in forming compound verbs, and often implying dissolution or separation; as in *to*-beat, to beat severely or thoroughly; *to*-break, to break utterly or in pieces; *to*-go, to go asunder or apart, to disperse; *to*-hew, to hew in pieces; *to*-rend, *to*-tear, etc. *Obs.*, exc. in all, to, under ALL, *adv.*

are many amphibians to which either name is applied. The typical toads are generally terrestrial in their habits, except during the breeding season, when they seek the water. They have a short, squat body, comparatively weak hind legs, and are covered with a rough warty skin in which are glands that secrete an acrid fluid. Most of the species burrow beneath the earth in the daytime and come forth to feed at night. They eat insects, worms, slugs, etc., and are hence most useful to man. The young, which hatch as tadpoles, attain the adult form within a few weeks. The natterjack and the common toad (*Bufo vulgaris*) are familiar European species. The common species of the eastern United States is *B. americanus*. Cf. AGUA TOAD.

2. *Music & Acous.* **a** A sound having such regularity of vibration as to impress the ear with its individual character, esp. as regards pitch, and to enter into harmonic relations; musical sound; — opposed to *noise.* See 7th SOUND, 2. A tone is characterized by its pitch (rate of vibration), its force (amplitude of vibration), and its timbre (complexity of vibration). A *simple* tone is one resulting from a simple vibration at a fixed rate. Its pitch is definite, therefore, although its force may vary, and it can hardly be said to have timbre. But nearly all musical sounds are *complex* (*composite*, or *compound*), that is, composed of two or more simple tones. These components are called *partial tones,* of which the lowest, which predominates and determines the pitch, is called the *fundamental tone,* or *fundamental,* and the others, *upper partials,* or *overtones.* The peculiar *quality* or *timbre* of a tone (called also *tone color,* or *clang tint*) is due to the number, vibration rates, and intensities of its overtones, and varies with the nature of the vibrating body and the mode of excitation. Overtones which are in the harmonic series of the fundamental (that is, having vibration numbers equal to 2, 3, 4, 5, etc., times that of the fundamental) are called *harmonics.* The tone of a tuning fork is nearly simple, that of a well-constructed musical instrument has chiefly harmonics for its overtones, while inharmonic overtones are usually prominent in the tone of a bell. See also HARMONIC, *n.*, 1 **a**; COMBINATIONAL TONE. **b** The large interval between contiguous sounds in the diatonic scale, the smaller being a *semitone;* a whole step.

may be connected to the root by a somewhat constricted *neck*. It is composed chiefly of *dentine*, surrounding a central **pulp cavity**, containing a vascular, sensitive pulp, and coated with *enamel* on the crown, and with *cement* (see these terms) on the root and sometimes also on parts of the crown. It develops deep in the jaw by the deposition of dentine about (and by the activity of certain cells of) a vascular papilla of mesoblastic tissue. The enamel is deposited by a down growth of the epithelium of the jaw, the **enamel organ**, and is hence (unlike the dentine) of epiblastic origin. In man the permanent teeth are eight in number in each side of each jaw, or 32 in all, and are arranged as shown in the cut. The milk teeth lack the molars. In birds teeth occur only in a few fossil forms. In the lower vertebrates teeth are commonly simpler in shape (often simply conical) and more numerous than in mammals, and are often capable of replacement as often as destroyed or worn out. They may be implanted in long grooves in, or ankylosed to, the bone, or simply embedded in soft tissues.

A *totem* is a class of natural phenomena or material objects — most commonly a species of animals or plants — between which and himself the savage believes that a certain intimate relation exists. . . . Whatever . . . [the relation] may be, it generally leads the savage to abstain from killing or eating his *totem*, if his *totem* happens to be a species of animals or plants. Further, the group of persons who are knit to any particular *totem* by this mysterious tie commonly bear the name of the *totem*, believe themselves to be of one blood, and strictly refuse to sanction the marriage or cohabitation of members of the group with each other. This prohibition to marry within the group is now generally called by the name of exogamy. Thus totemism has commonly been treated as a primitive system both of religion and society. *J. G. Frazer.*

God made the country, and man made the *town.* *Cowper.*

5. Specif., in the United States : **a** In the New England States, a municipal corporation of a less complex character than a city, the sovereign authority being the **town meeting,** or general assembly of all the qualified voters, which elects all officers and decides all local governmental matters ; a township (not so called in New England). The *town* is the oldest unit of administration, the county having been formed by the grouping of towns for certain purposes. The chief executive officers are the selectmen. Usually towns, when they have grown too large for government by a town meeting, become cities. In some cases in Connecticut, separate municipal corporations (cities and boroughs) have been formed, as a result of the compacting of population, within the town area, their limits being usually smaller than, but in some instances coextensive with, those of the town. This causes a part or the whole of the town area to have a dual government. **b** In other States, a unit of rural administration more or less like the New England town ; a township (which see).

2. In the United States, a primary unit of local government of varying character in different parts of the country. In New England, where it is called *town* (which see), it exists in its primitive form except as modified and partly subordinated by the later formed units, the county and State. In the northwestern States the county is the older unit and the township is a division of the county. In New York the township is nearest to the New England town in order of development ; in Pennsylvania and elsewhere south of New York the county is the more important unit ; in some of the southern States, where the county is the chief and almost the only unit of local government, a rudimentary kind of township system has been adopted ; elsewhere, where there are townships, they are much less important than the county. Township organization varies greatly. In New England, where it is most important, the governing body is uniformly the town meeting (see TOWN, 5 **a**) ; elsewhere where it is most vigorous there is also a town meeting with somewhat less extensive powers than those of the body in New England ; in Pennsylvania and the South there is no town meeting, but only executive machinery. Outside of New England there are no selectmen or officers with exactly the same functions ; where organization is most complete, at the head of the administration stands one or more supervisors. In Maine, New Hampshire, and Vermont there are unorganized subdivisions of the county called townships, which are simply tracts of land laid off by the State authorities.

3. In surveys of the public land of the United States, a division of territory that is, with certain exceptions, six miles long on its south and east and west boundaries, which follow meridians, and so slightly less than six miles on the north. It contains 36 sections, and has often formed the basis of a later political township.

Trac-ta'ri-an-ism (-ĭz'm), *n. Eccl. Hist.* A system of principles set forth in a series of 90 pamphlets issued at Oxford between 1833 and 1841 and called "Tracts for the Times." The publication of the tracts was a stage in a great movement in the Church of England, known as the *Oxford movement*, the actual beginning of which is usually dated from a famous sermon on national apostasy preached by John Keble in St. Mary's, Oxford, in July, 1833. The movement was an uprising against the Erastianism and liberalism of that day and in behalf of that conservative, patristic, sacramental form of piety and theology, of which Laud, Andrewes, and Cosin, of the 17th century, were the chief exponents. The tracts were put forth to instruct the clergy and laity esp. in the doctrine of apostolical succession, which was asserted to be essential to the existence of a true church and by virtue of the possession of which the Church of England was maintained to be a branch of the Church Catholic, a visible and external organization founded by Christ and the apostles ; and in the doctrine of the efficacy of the sacraments as sources of divine grace, the Eucharist as administered by and through the Church being the means of salvation, and regeneration being inseparably connected with baptism. The disapproval aroused by Tract No. 90, written by Newman, in which an attempt was made to show that the Thirty-nine Articles admit of a "Catholic" interpretation and are designed in some cases to oppose dogmas of the Roman Catholic Church, but more often abuses connected with them, but not taken up into the Roman system, caused the discontinuance of the series. The movement, however, went on, profoundly affecting the Church of England and extending far beyond its bounds, nor was it stopped by the secession of Ward, Newman, and others to the Church of Rome. Modern countries usually give special statutory protection to such trade-marks as can be and are registered under certain statutory provisions; but a qualified right to protection exists at common law. A trade-mark is now considered a property at least to the extent that it is transferable, if transfer does not involve fraud on the public.

There was no property in any *trade-mark* or trade name which the [common] law recognized; but there was a sort of qualified right therein recognized by the [common] law, sufficient to prevent any fraudulent use thereof in connection with the same classes of goods as those to which it had been appropriated by the original inventor thereof. The ground of the court's interference to prevent such fradulent use was to save the public from a fraud. *Stephen's Commentaries*

The essence of a *trade-mark* is that it distinguishes the owner's goods, and the essence of an infringement where the essential particulars are not bodily appropriated) is that the use of the mark upon the defendant's goods is calculated to lead purchasers to buy them as plaintiff's goods. *Encyc. of the Laws of Eng.*

1. A dramatic composition depicting a serious story, in which, typically, the leading character is by some passion or limitation brought to a catastrophe; also, generically, drama of this type, or the composing or acting of it. Greek *tragedy* is severely simple in plot and incident. The dialogue is in verse and is interspersed with choral odes. The action as a whole is conceived as a representation of fate, in which the characters are somewhat passively involved. Modern *tragedy* is typically complex and varied in plot, and at the present day is more characteristically in prose. The action is conceived as the free working out of the individual characters. See CHORUS, 1; DRAMA, 2.

Tragedy is an imitation of an action that is serious, complete, and of a certain magnitude; in language embellished with each kind of artistic ornament, the several kinds being found in separate parts of the play [i. e., verse in the dialogue; song in the choral parts]; in the form of action, not of narrative; through pity and fear effecting the proper katharsis, or purgation, of these emotions. *Butcher (Aristotle).*

2. Quality or character such as that of the events portrayed in tragedies; that quality of life or art which gives nobility or sublimity to catastrophe and excites in the beholder combined feelings of pity and awe. *Tragedy* is primarily a conflict or collision leading to catastrophe. Aristotle noted that the catastrophe commonly follows from guilt or error, leading to the view, developed by later writers, that the tragic motive is a working out of poetic justice. The tragic motive has also been regarded as the enforcement of the lesson of human limitation and of the presumption of effort to overstep natural constraints. Thus *tragedy* is taken to represent the triumph of a moral idea, or, as with Hegel, the overthrow of the individual by the universal.

3. Any literary composition, as a novel or narrative poem, whose theme has the quality or character of tragedy.

Go, litel book, go litel myn *tregedie.* *Chaucer.*

4. The theory or art of composing or of acting tragedies.

Syn. — TRANSCENDENT, TRANSCENDENTAL. That is TRANSCENDENT which is of superlative quality; TRANSCENDENTAL, in ordinary language (for philosophical usage see defs.), applies esp. to opinions, theories, or sentiments which are so vague, fantastic, or extravagant as to pass one's ordinary comprehension; as, "clothed with *transcendent* brightness" (*Milton*); "this thrice-refined pabulum of *transcendental* moonshine" (*Carlyle*). tran'scen-den'tal-ism (trăn'sĕn-dĕn'tăl-ĭz'm), *n.* [Cf. F. *transcendantalisme*, G. *transcendentalismus.*] **1.** *Philos.* **a** In the Kantian sense, the transcending, or going beyond, experience, and ascertaining a priori the fundamental principles of human knowledge. Schelling and Hegel assert the absolute identity of the objective and subjective in human knowledge, and consequently the Kantian distinction between *transcendent* and *transcendental* has no place in their philosophy; hence, with them, *transcendentalism* claims a true knowledge of all things, material and immaterial, human and divine, so far as the mind is capable of knowing them. And in this sense the word *transcendentalism* is now most used. It is also sometimes used for that which is vague and illusive in philosophy. **b** Any philosophy which asserts the domination of the intuitive or spiritual over the purely empirical; esp., the philosophy of Ralph Waldo Emerson and his followers and the social and religious tendencies to which it gave rise; — so called because of a wrongly supposed relation to Kant's philosophy.

TRANSFORM, the general word, implies a thorough or radical change, whether in appearance or nature; TRANSFIGURE, which is strongly influenced by Biblical usage, suggests an exaltation or glorification of the outward appearance; as, "The placid sunshine . . . seems to have been *transformed* in a moment into imperious angry fire" (*W. Pater*); "Jesus . . . was *transfigured* before them: and his face did shine as the sun" (*Matt.* xvii. 2); "If she be guilty, 't will *transform* her to manifest deformity . . . If innocent, she will become *transfigured* into an angel" (*Shelley*). TRANSMUTE implies a complete change of nature or substance, esp. from lower to higher; to CONVERT (often interchangeable with *transmute*) is esp. to turn from one state or condition to another; as, "Physiological activity must be *transmuted* into intellect and conscience" (*Mrs. Humphry Ward*); "Every health which I begin *converts* dull port to bright champagne" (*Shenstone*); "Conviction . . . is worthless till it *convert* itself into conduct" (*Carlyle*). METAMORPHOSE suggests a transformation into something utterly different, often by (or as if by) enchantment; TRANSMOGRIFY is humorous or colloq. for *metamorphose*; as, "*metamorphosed* from seemly shape to birds and ugly beasts" (*Gascoigne*); "The name 'navvie' . . . has been *transmogrified* into 'navigator'" (*Lowell*). See CHANGE, MODIFY, FORM.

INDUCTION COIL). One coil (the *primary*) is connected to the line, and the other (the *secondary*) to receiving devices. The ratio of the number of turns of the two coils is the **ratio of transformation,** voltages being transformed directly, and currents inversely, in this ratio. Cf. 2. In early English law, the betrayal of a lord by his vassal; later, in early feudal law, the violation by a vassal of his allegiance to his superior by any of various undefined acts of a serious nature, such as betrayal to an enemy, adultery with his wife, forgery of his seal, etc. Treason was of two kinds, high treason, when committed against the king, and petit, or petty, treason, when committed by a vassal against his lord or superior. The Treason Act (25 *Edw. III.*, c. 2, 1351) restricted petty treason to: the killing of a husband by his wife, of a master by his servant, and of a prelate by an ecclesiastic owing obedience to him. The same statute defined high treason under five different heads (compassing or imagining the death of the king, queen, or their eldest son and heir; violating the king's companion (queen), his eldest daughter unmarried, or the wife of the king's eldest son and heir; levying war against the king in his realm; giving aid and comfort to the king's enemy; slapping the chancellor, treasurer, or the king's justices while administering justice). Orig. high treason was marked off from all other crimes by a peculiarly ghastly punishment (hanging, drawing, and quartering), by being unclergyable, and by the fact that the traitor's land was forfeited to the king instead of escheating to the lord. See FELONY, 2. Petty treason is now punished only as murder; high treason remains now essentially as under the Treason Act which was confirmed and made perpetual by 57 Geo. III., c. 6. In the United States treason against the United States is defined by the Constitution (Art. 3, sec. 3) to consist "only in levying war against them, or in adhering to their enemies, giving aid and comfort to them." Most of the State constitutions similarly define treason against the State. Cf. 1st MISPRISION, 1.
3. Hence: In general, the offense of attempting by overt acts to overthrow the government of the state to which the offender owes allegiance, or (in monarchies) to kill or personally injure the sovereign or his family.

Sometimes, as distinguished from **trespass on the case** (which is where the injury is not the immediate result of violence), called **trespass vi et armis**. The action of **trespass quare clausum fregit** (so called from words in the old Latin writ) is for the breach of the close (see 6th CLOSE, 3). **4.** *Law.* Sometimes short for *trespass on the case*.

A triad lacking any of its three tones is an **imperfect triad**, a **perfect triad** being complete and in its fundamental position, that is, with the root in the bass (fig. 5). A triad having another tone than the root in the bass is an **inverted triad**, the third in the bass giving the **first inversion** (fig. 6), the fifth in the bass giving the **second inversion** (fig. 7). Inverted chords are named from the intervals between the bass and the other tones. See THOROUGH BASS. In textbooks of harmony triads are generally designated by Roman numerals cor-

responding to the scale tones composing their roots, large numerals being used for major triads, small ones for minor triads, with an added accent or small cipher for an augmented or a diminished triad respectively. The major or minor scale on which a series of triads is founded is sometimes also indicated by a capital or small letter. Thus fig. 8 shows the triads on the scale of *C* major; fig. 9, those on the scale of *a* minor. 9. *Law.* The formal examination of the matter in issue in a cause before a competent tribunal for the purpose of determining such issue; the mode of determining a question of fact in a court of law. A trial may be of an issue of law, when it is before a judge alone; or of fact, when it is usually before a judge and jury. In a general sense *trial* includes all proceedings from the time when issue is joined, or more usually when the parties are called to try their case in court, to the time of its final determination; in criminal law the term *trial* is, however, generally restricted to proceedings subsequent to swearing in the jury.
10. Evidence; proof. *Obs. Scot.*

Syn. — Proof, ordeal; criterion, standard. — EXPERIMENT, TRIAL, TEST. An EXPERIMENT has for its object esp. the discovery of something as yet unknown, or the verification or illustration of what is already ascertained; it does not necessarily imply that anything is at stake; as, scientific *experiments;* "He was not excessively fond of wine, but he had several times taken too much, simply as an *experiment* in that kind of ecstasy" (*G. Eliot*). *Trial* and *test* suggest more definitely that something is being put to the proof; TRIAL is the wider term; a TEST is a decisive trial or criterion; as, "the world's challenge to make *trial* of it" (*W. Pater*); "those who bring all characters to the *test* of true wisdom" (*Cowper*); "In literary examinations, it is a *test* of good scholarship to be able to construe aright; . . . and those who have acquitted themselves best in the *trial*, will often be disposed to think they have most notably failed" (*J. H. Newman*). See TRY, EXAMINATION.

Eng. Law,* a trial in which the case was settled by the individual observation and decision of the judge upon the testimony of his own senses, without the intervention of a jury. — **t. by record,** a trial which is had when a matter of record is pleaded, and the opposite party pleads that there is no such record. In this case the trial is by inspection of the record itself, no other evidence being admissible. — **t. by the country.** See COUNTRY, *n.*, 7. — **t. of the pyx,** the annual testing, in the English mint, of the standard of gold and silver coins.

trial balance. *Bookkeeping.* The testing of a ledger to discover whether the debits and credits balance, by finding whether the sum of the personal credits increased by the difference between the debit and credit sums in the merchandise and other impersonal accounts equals the sum of personal debits. Without specification, a *plane triangle* is meant. A plane triangle is designated as *scalene, isosceles,* or *equilateral*, according as it has no two sides equal, two sides equal, or all sides equal; and also as *right-angled*, or *oblique-angled*, according as it has one right angle, or none; and an oblique-angled triangle is either *acute-angled* or *obtuse-angled*, according as all the angles are acute, or one is obtuse. These terms, except *oblique-angled*, are applied to spherical triangles in the same sense as to plane triangles.

2. The hero of a medieval romance originally not connected with the Arthurian cycle, but early incorporated into it as a knight of the Round Table. He was sent to Ireland by King Mark of Cornwall, his uncle, to fetch the king's bride, **Isolde the beautiful**, and on the return voyage he and Isolde were made to partake of a potion which rendered them permanently in love. According to the version adopted by Tennyson in his "Idylls of the King," Tristram was stabbed by King Mark, who surprised him with Isolde. According to that followed by Matthew Arnold in "Tristram and Iseult," he fled to Brittany, where he married another Isolde, called **Isolde of the white hand.** Being wounded, he sent for Isolde the beautiful to come and cure him. The messenger is to hoist a white sail if Isolde returns with him. He does so ; but Tristram's wife tells him the sail is black, and at this he dies. In Wagner's "Tristan und Isolde" there is only one Isolde, the wife of Mark. The lovers are discovered by the king, and Tristan lets himself be wounded by the king's squire, and then, in his castle, awaits the ship of Isolde. She comes, and he, desiring to meet her as when first he saw her, with bleeding wounds, tears off the bandage and dies in her arms. Isolde falls dead on his body. Swinburne also has treated the story in "Tristram of Lyonesse."
